

Cover image: Pictured is a radiocollared snowshoe hare. The snowshoe hare is one of 10 mammal species worldwide that undergo seasonal changes in coat color that provide camouflage in snow-covered terrain. The initiation dates of seasonal coat color change are influenced by photoperiod, and are unaffected by the presence of snow. L. Scott Mills et al. estimate that by the end of this century, the projected decline in the number of days with snow on the ground will substantially increase the exposure of white hares mismatched on a brown, snowless background. See the article by Mills et al. on pages 7360–7365. Image courtesy of L. Scott Mills.

From the Cover

- 7360 Snow cover and seasonal coat color
- 7154 Cellular RNA interaction networks
- 7348 Monarch butterfly navigation
- 7452 Intracellular human papillomavirus trafficking
- 7494 Molecular adaptation to loud sounds
